

ALADIN

(List of likely understaffed activities for 2008)

Ljubljana, 8/11/07

List of topics (without order of priority)

- Phys-dyn coupling
- ALARO-0 scientific maintenance
- NH-VFE
- DFI developments
- Transparent LBCs (?)
- GLAMEPS contributions
- Surface issues for LAM-EPS coupling
- DA surface emissivities and land temperatures

Main characteristics

- List very compatible with the 4 year outlook
- EPS, Surface and ‘Coupling’ as linking themes
- Chaining topics (i.e. most of the time cross-cutting issues => too specialised view of the home work ?)
- All quite ‘advanced’ manpower requiring. The good manpower is too much drained towards other issues for lack of ‘priority enforcement’ seen as a global issue => forcing ‘less key people’ to be as flexible as ‘key people’ (and hence to change topics) is one of the ways out of our problems, if not the main one.
