Why PROFORCE ?

Severe Weather

Damage

Prevention and Preparedness

Crisis management

Weather forecasts
Warnings

Project Information

- **Project logo:**

- **Project duration:** 24 months

December 1st 2013 – November 30th 2015

- **Partners:** 4 partners from Austria and Hungary

- ZAMG, meteorology Austria, lead partner
- NOEL-CP, Provincial Government of Lower Austria, civil protection Austria
- OMSZ, Hungarian Meteorological Service, meteorology Hungary
- DMDSC, Disaster Management Directorate of Somogy County, civil protection Hungary

- **Website:** www.echo-proforce.eu

Project Objectives

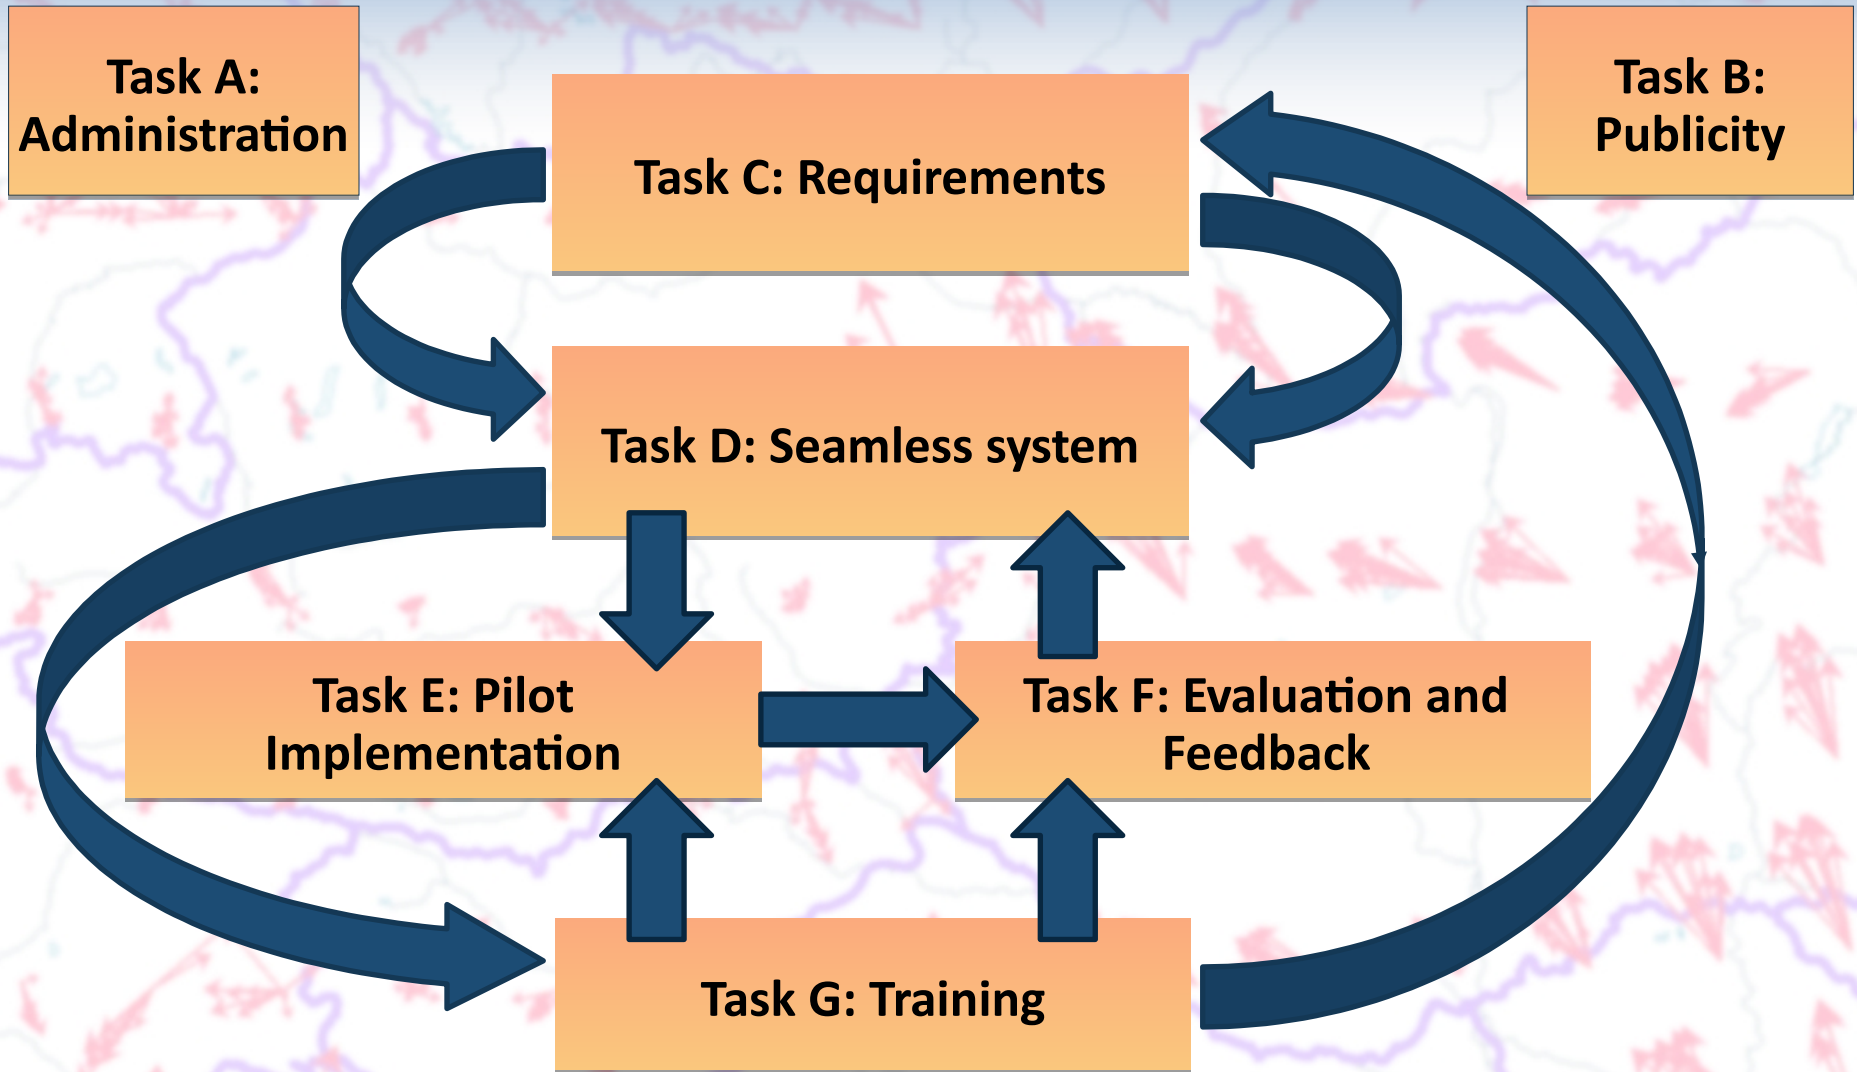

Set-up of an innovative probabilistic forecasting system in a seamless way from several days ahead (low spatial resolution) to several hours ahead (high spatial resolution)

Improvement in the accuracy and timeliness of severe weather warnings due to information about the uncertainty and predictability of severe weather events

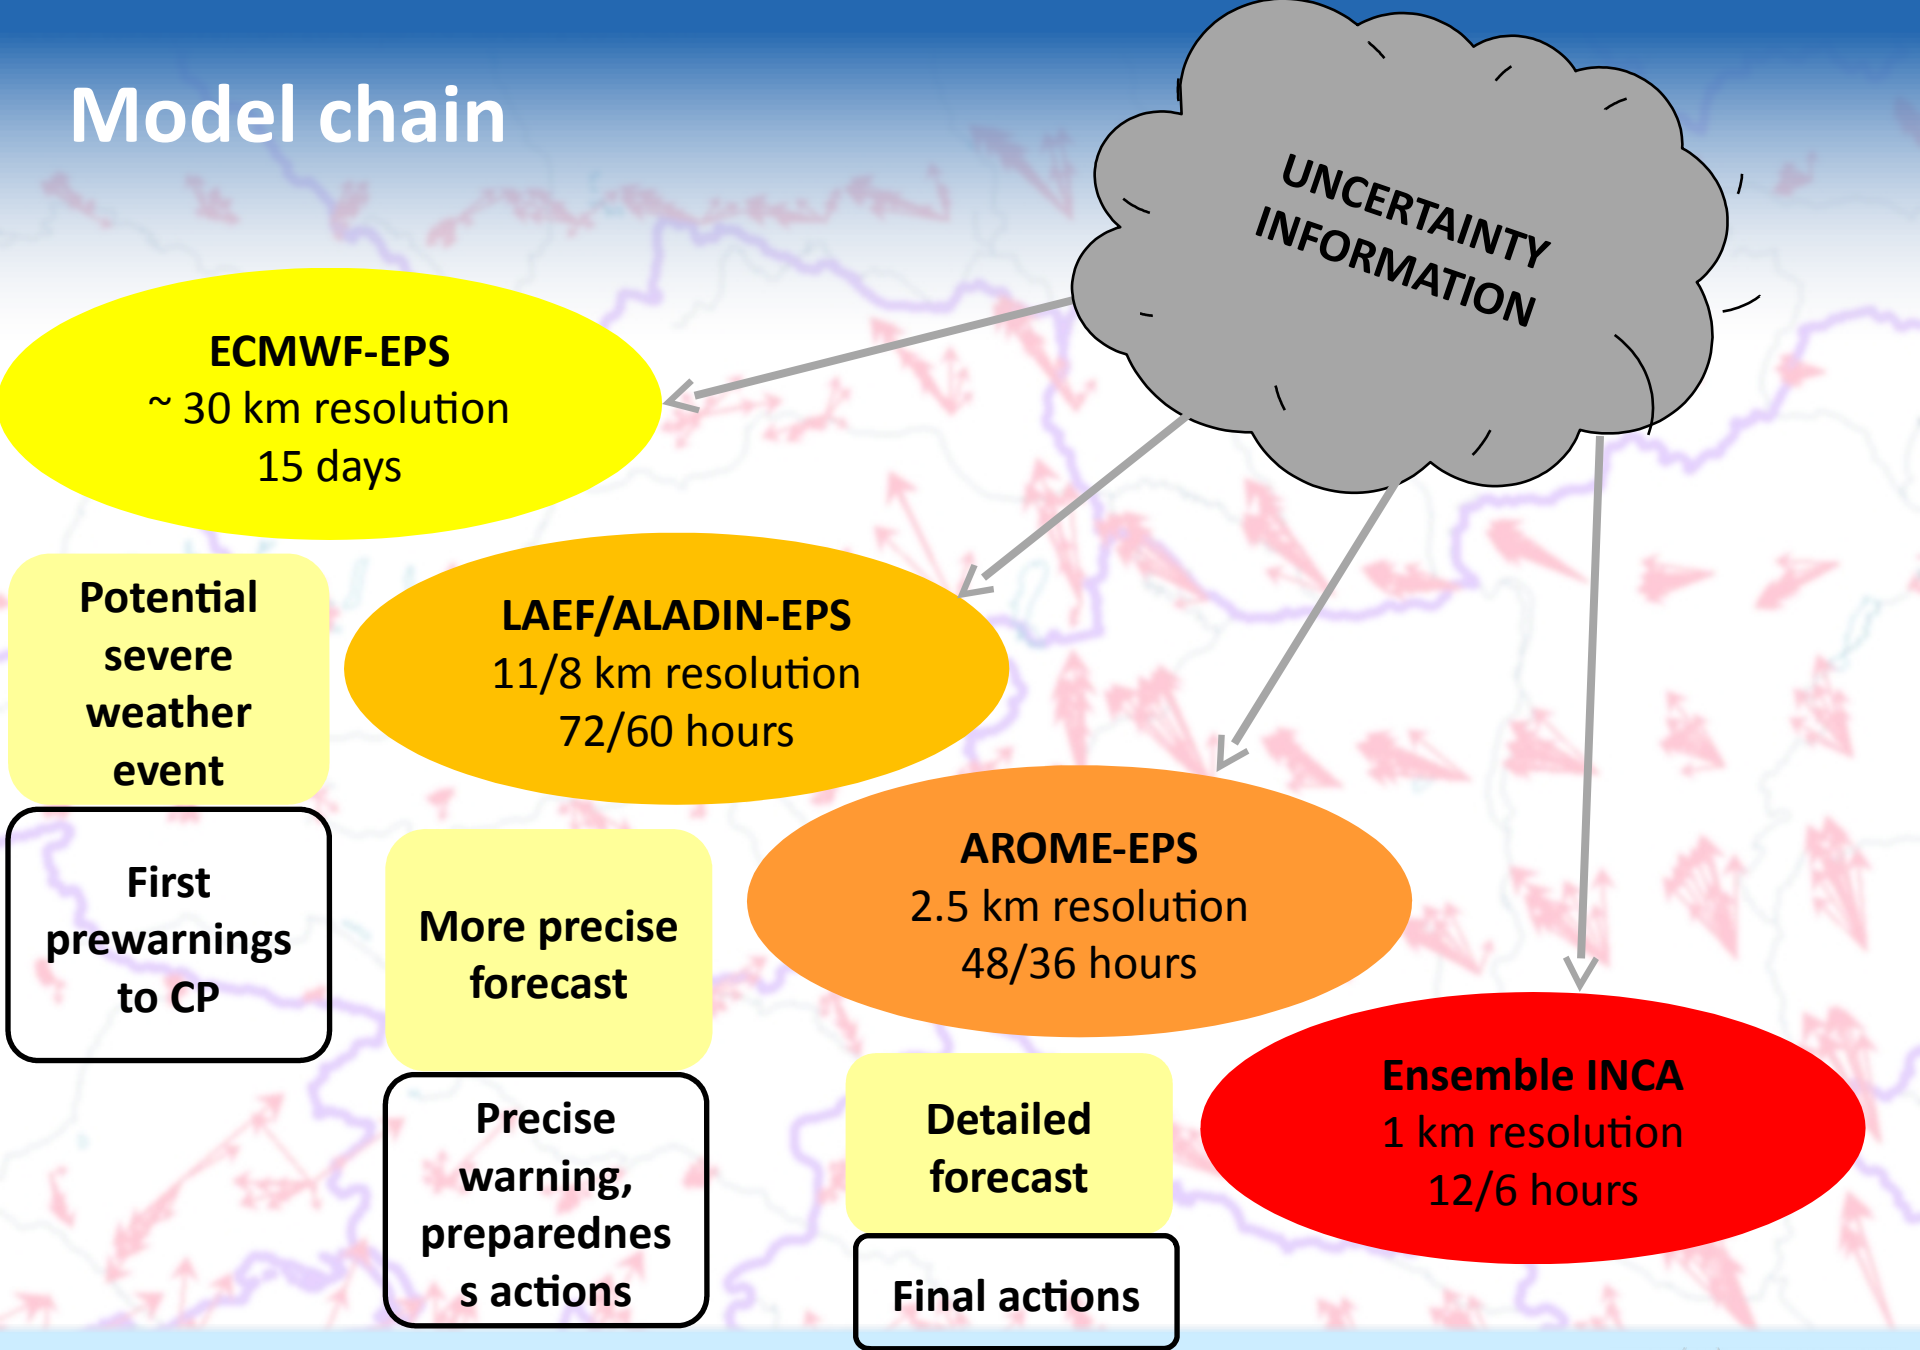

Improve preparedness and decision making procedures in civil protection agencies by using probabilistic forecasting system

Strengthen the cooperation between scientists and civil protection people and intensify the transnational cooperation between Austria and Hungary

Webportal

Threat level: In case of the main threat level indicator also the forecast time plays a role. The farther into the future the valid date lies the more severe a potential severe weather has to be to have an impact on the indicator. In doing so we acknowledge the general decay of forecast quality with increasing lead time.

The current overall threat level is:

(mainly) caused by: strong wind

Application

- **Optimize decision making procedures in terms of preparedness and awareness:**
 - in case of severe weather events

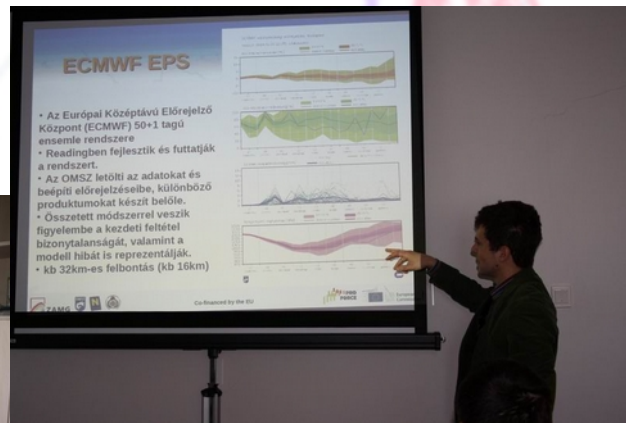

- in the course of mass events

Training

One key point of this project is the training of the CP people to get used to probabilistic forecasts:

- Common trainings with model developers, forecasters and users in CP
- Transnational training sessions (one in Hungary, one in Austria)
- Integrate the feedback of the users to improve the system

Case studies

■ Storm Yvette 15. – 17.5.2014

strong storm affecting both countries, major damage due to high wind speeds (>120km/h) and heavy precipitation (~150mm/36h -> floodings)

■ Winter storms Elon and Felix 8. – 11.1.2015

gusts up to 130km/h over large parts of Austria, heavy damage to forests

■ Storm Niklas 30.3. – 1.4.2015

gusts up to 140km/h in the flat areas and 190 km/h in the mountains, up to 2m snow in the mountains - avalanches

First success

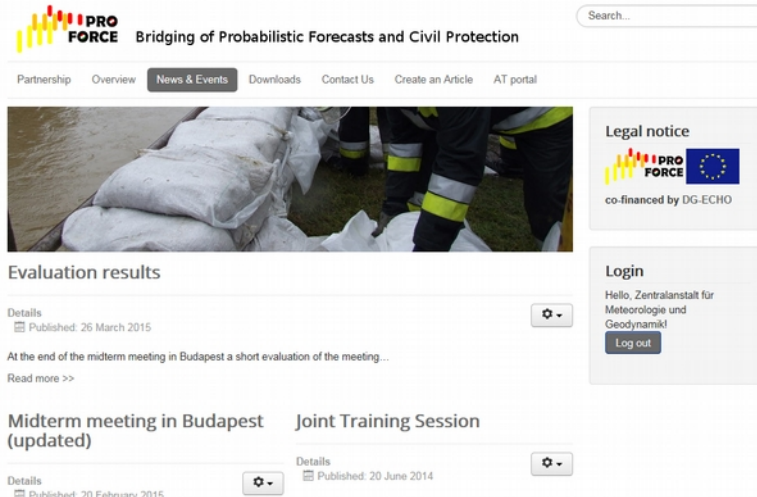

- Simple idea: combine different EPS forecasts to one portal and provide it to CP users
- First use of probabilistic forecasts in disaster management in both countries
- Extremely positive feedback of CP users
- The feedback of the users helped a lot to improve the webportal and to make forecasts more applicable and user-friendly
- With the help of EPS forecasts the 2014 Lake Balaton swimming contest (> 7000 participants) was postponed (strong gusts); first awareness already several days ahead
- Massive storm event „Niklas“ in March 2015 (gusts up to 140km/h in the flat areas, 190km/h in the mountains); CP agencies were informed several days in advance
