

**The performance of the
operational 4km
resolution HIRLAM and
UM runs at met.no**

Thor Erik Nordeng

Outline

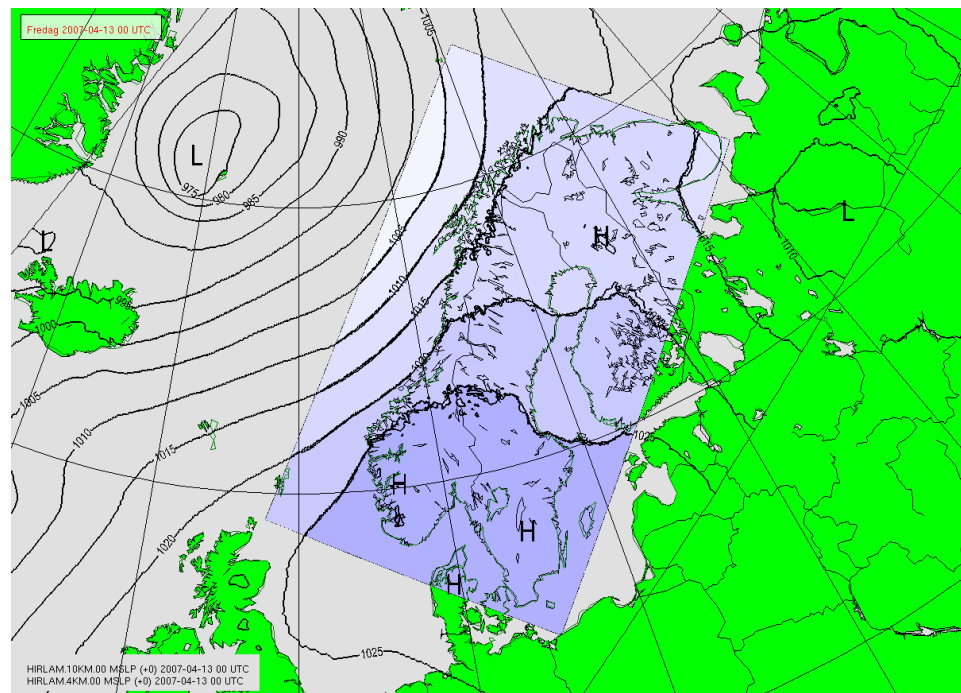

- Hirlam and UM set-up
- Long term performance
 - verification of **surface** temp, wind and precipitation
- Case studies
 - heavy precipitation events
 - snow melt

HIRLAM and UM set-up

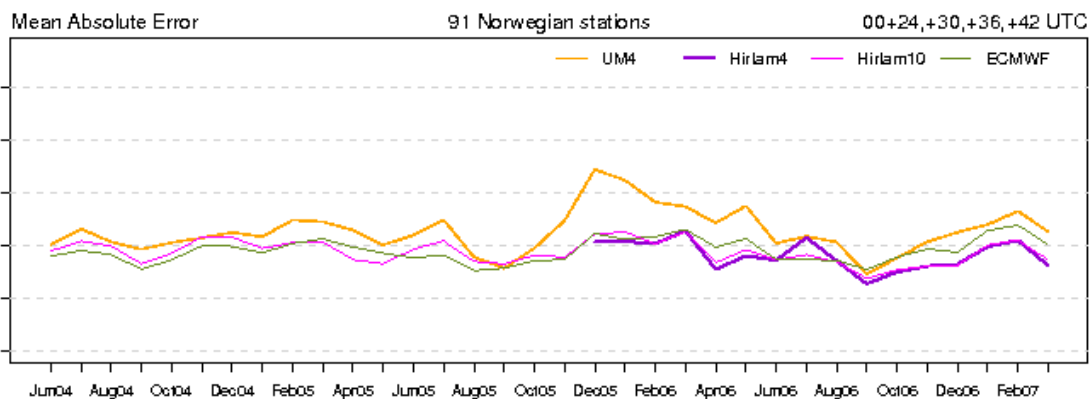

- same area
- same topography
- ~ same climatology
- same horizontal grid

- different equations
 - hydrostatic vs non-hydrostatic
 - normalized pressure vs normalized height
- different vertical staggering (Lorenz vs. Charney-Phillips)
- different physics

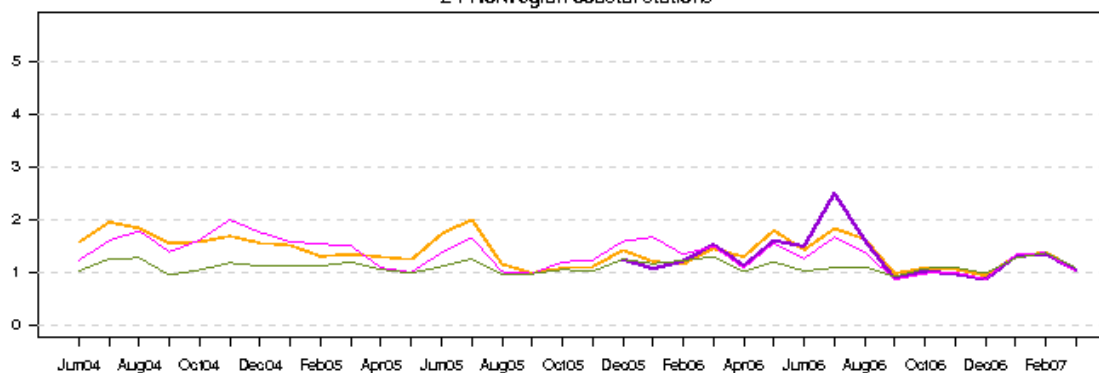

Temperature 2m

24 Norwegian coastal stations

9 Norwegian inland stations

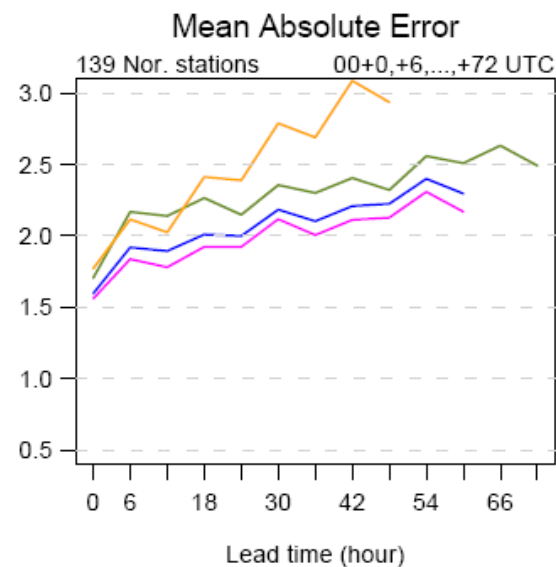

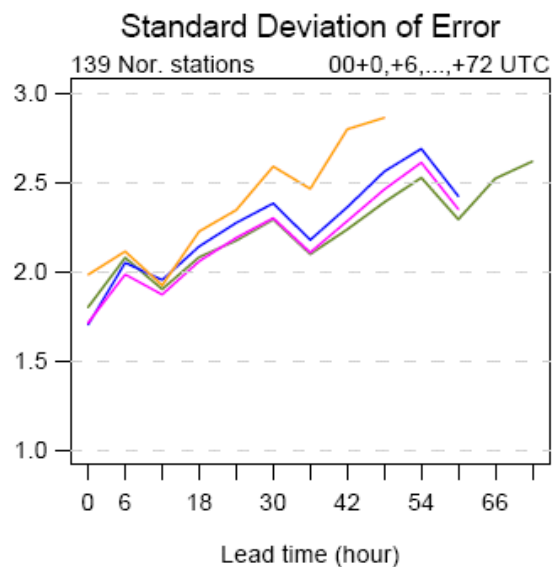

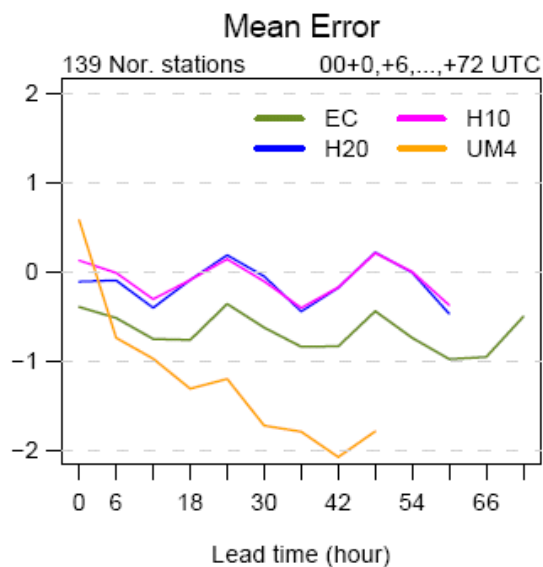

Temperature 2m

UM4 has a problem related to temperature in winter

Wind speed 10m

Wind speed 10m

Wind speed and direction

Observed precipitation (standard – in situ)

Precipitation previous week (01.03.2007)

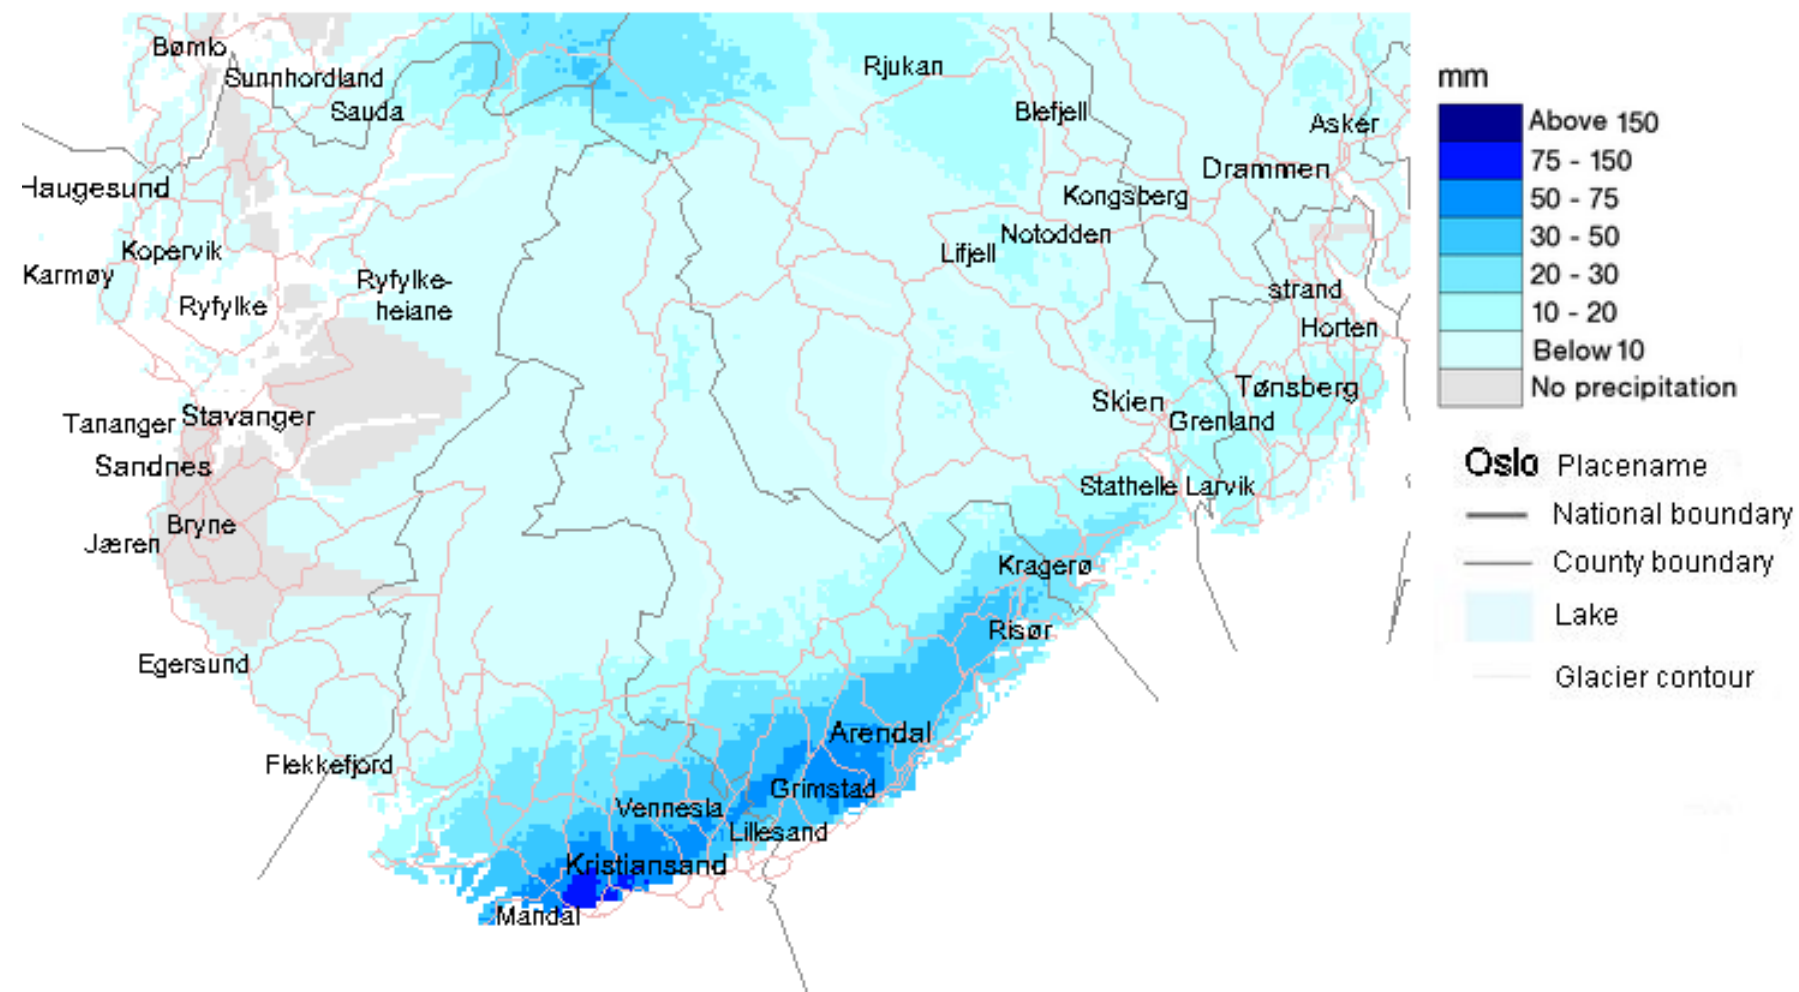

Accumulated precipitation HIRLAM4

Accumulated precipitation UM4

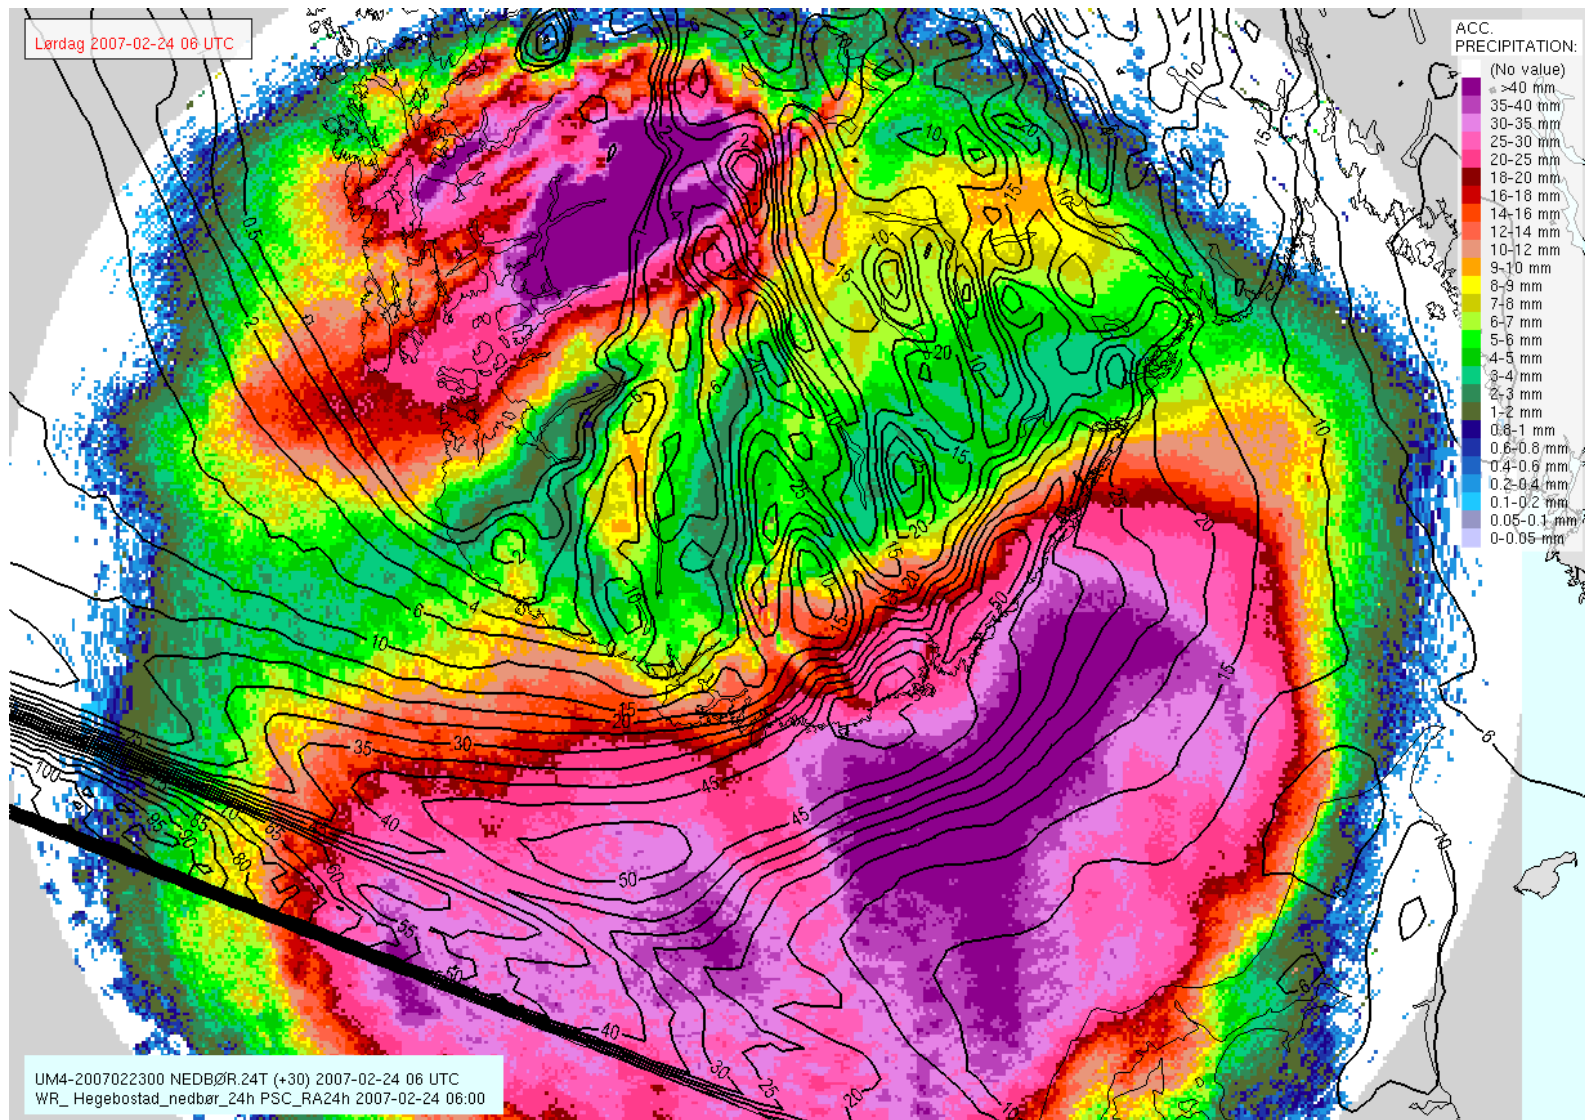

The extreme event, 23-24 February

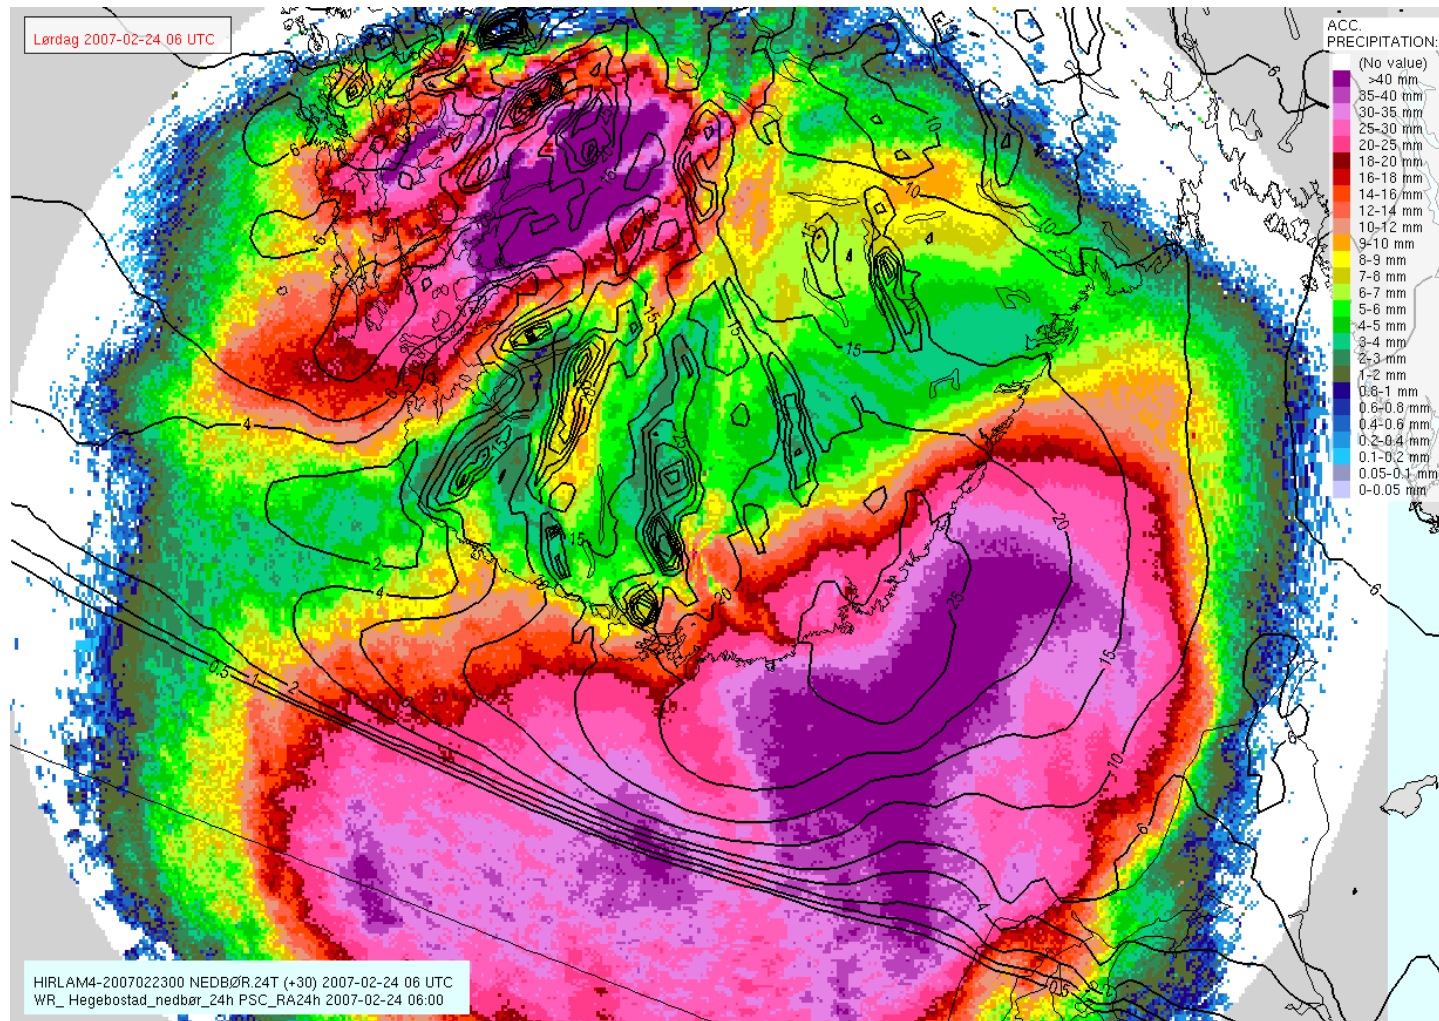

UM4 prec 23/2-06 to 24/2-06

HIRLAM4 prec 23/2-06 to 24/2-06

Possible explanations for the difference between HIRLAM and UM for this case

1. land-sea definition, climatological preset fields, e.g. land/sea contrast
2. non-hydrostatic effects
3. Parameterisation of condensation /precipitation

Coastal convergence and vertical velocity in UM

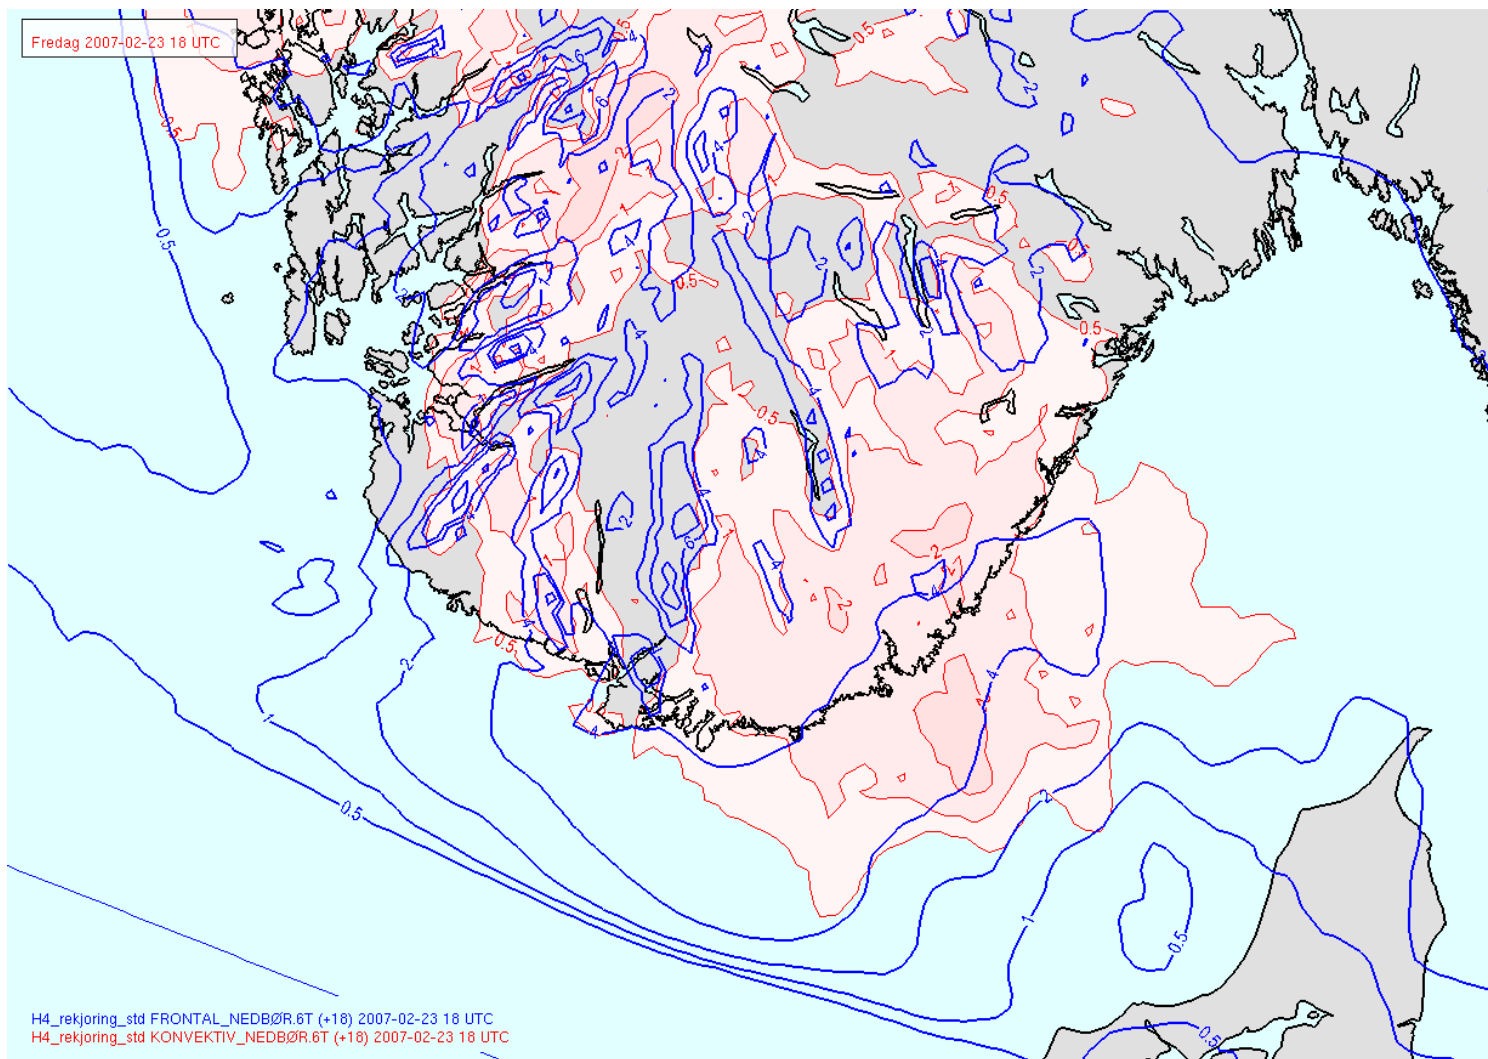

Coastal convergence and vertical velocity in HIRLAM

HIRLAM -stratiform precip. HIRLAM-convective precip.

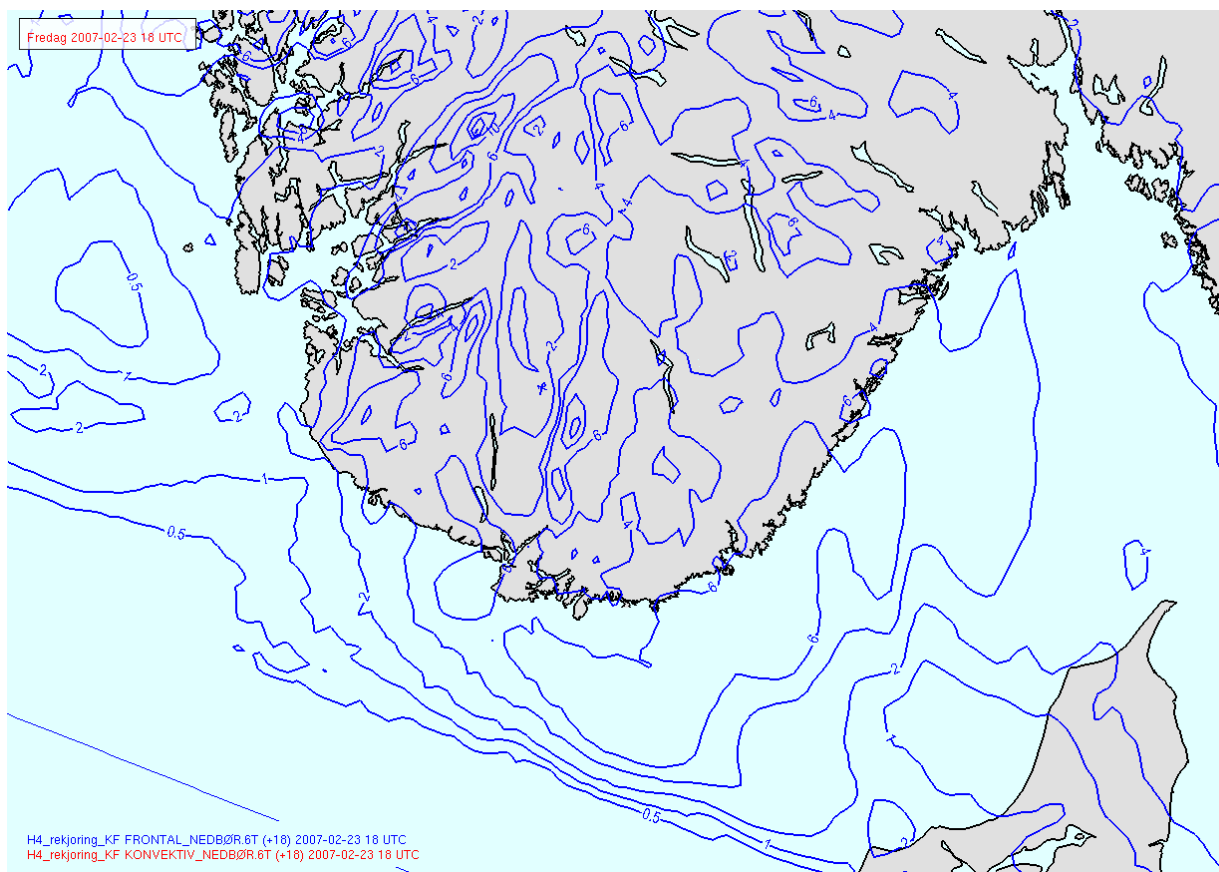

UM -stratiform precip UM-convective precip

HIRLAM -Stratiform precip (Rasch/Kristjansson)

HIRLAM-convective precip (Kain/Fritsch)

Why is there a difference?

1. Land/sea contrast

UM has land or sea, HIRLAM has fractional land
The coastal convergence is slightly stronger in UM
The vertical velocity along the coast is stronger and more organised in UM

2. Parameterisation of microphysics and precipitation

HIRLAM (std) has significant amounts of convective precip

HIRLAM (KF) has stratiform condensation only (small improvement)

UM with modified micro physics (= further improvements)

3. Non-hydrostatic effects

not likely? (stable stratification, gentle topographic slope...)

Lyngsalpene

Snow depth

23 April 00 UTC +48

Conclusions based on duty forecasters subjective opinion and objective verification

Precipitation: UM4 best in limiting precipitation extent
Sometimes peculiar precipitation distribution in HIRLAM

Wind: UM4 best in describing local off-shore winds
(drainage flow) out fjords and valleys. Also best for
winds steered by orography. Able to forecast strong
winds in mountains. HIRLAM4 also good at coasts (wind
speed).

Screen temperature: HIRLAM4 best, particularly in winter

Snow: Too rapid snowmelt, particularly in HIRLAM4

Polar lows: Both models are pretty good. OK strength but
some displacements errors.

A scenic view of a city at night, with the city lights visible in the foreground and mountains in the background under a clear sky. The text "Thank you for your attention!" is overlaid on the image.
