Trond Iversen, Marit H. Jensen, Hilde Haakenstad, Ole Vignes

The ensemble systems at met.no

TEPS – Targeted EPS

- A dedicated version of ECMWF **EPS**.
Runs at ECMWF
 - 20 + 1 ensemble members, as opposed to 50 + 1 for EPS
 - Target area Northern Europe and adjacent sea areas, as opposed to NH north of 30°N(*)
 - Starts at 12 UTC every day
 - Runs to +72h, as opposed to +240h for EPS
- T399L62 (~55km)

LAMEPS

- HIRLAM in ensemble set-up (6.4 -> 7.1)
- Quasi operational at met.no since 14 February 2005
- 20 members + control
 - Control based on Norwegian HIRLAM analysis
 - 20 initial and open boundary perturbations from TEPS, hence the perturbations are consistent
 - Starts at 18 UTC every day (fresh HIRLAM analysis), i.e. a 6 hour delay compared to TEPS and EPS
 - Forecast range: +60h
- Resolution: 0.2° (~ 20 km), 40 levels

NORLAMEPS

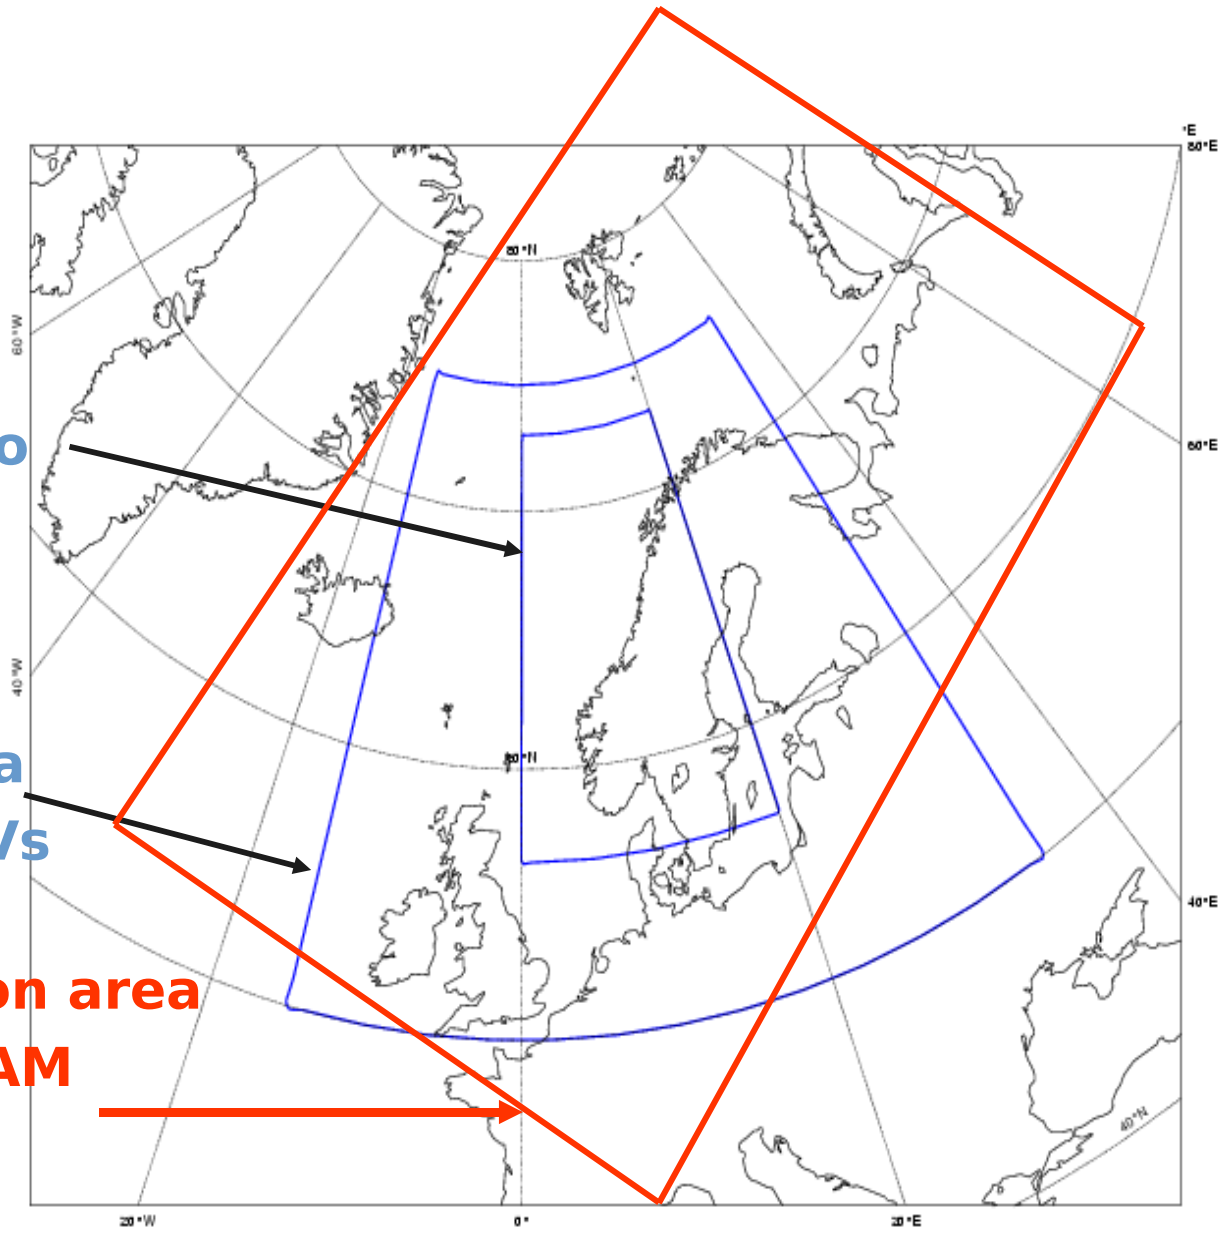

- Combines simply IFS TEPS and HIRLAM LAMEPS
 - A simple “multi”-model, multi-initial-state ensemble
 - 41 + 1 ensemble members

Options for improving TEPS:

- Reduction of initial amplitude by about 30-50%
- Larger optimisation region and more SVs
- Higher resolution and shorter optimisation time
- Combination of targeted SVs with hemispheric SVs. (Targeted SVs orthogonal to hemispheric SVs.)
 - It permits to reduce the optimisation time for the targeted SVs
- Twice a day?
- What about SBUs?

Future developments for LAMEPS

- Include perturbations of model physics in LAMEPS
- Increase the time resolution of the boundary fields (now every 6 hour)
- Increase resolution
- Hopefully these changes in TEPS and LAMEPS will lead to an improved in the two individual systems and in the combination ensemble NORLAMEPS

A photograph of a sunset or sunrise sky. The sky is a deep blue, with a prominent, elongated, pinkish-red cloud streak running diagonally from the upper left towards the center. Below this, there are more scattered, lighter clouds. The bottom of the image shows the dark silhouettes of trees and a portion of a building's roofline on the right side.
