Model chain at ZAMG

▶ ECMWF

16km, +240h, 2 runs

▶ ECMWF EPS

30km, +240h, 2 runs
50+1 members

▶ ALARO

4.8km, +72h, 4 runs

▶ ALADIN LAEF

11km, +72h, 2 runs
16+1 members

▶ AROME

2.5km, +30h, 8 runs

▶ AROME EPS

First tests with
pure downscaling
of LAEF

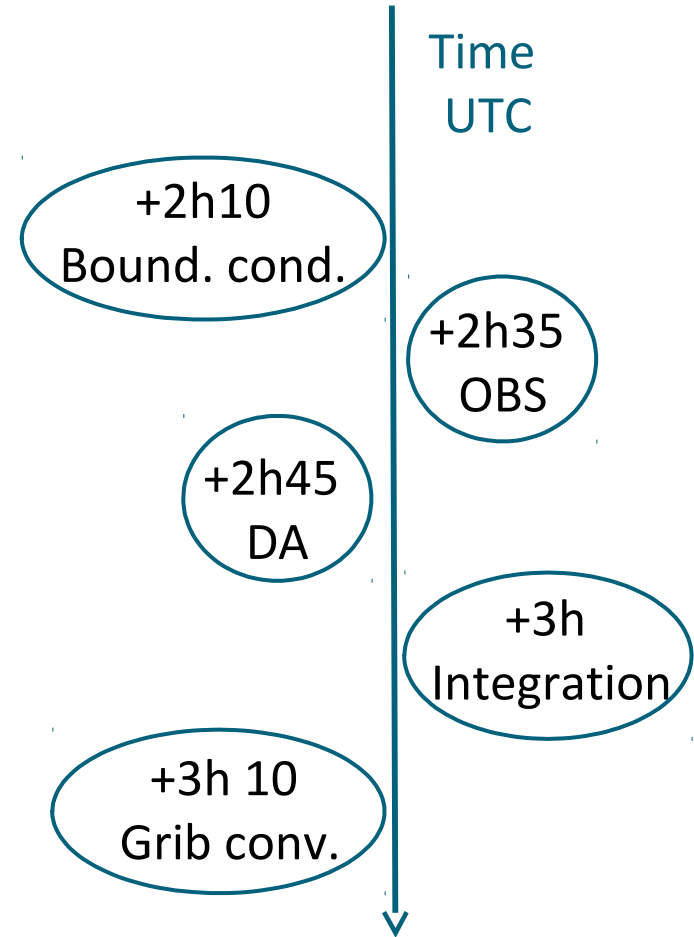

SGI ICE X

AROME history at ZAMG

- ▶ **Before 2011:** first test runs with AROME on a small domain, no data assimilation, aggregation of know how
- ▶ **2011:** intensive work on implementation of AROME at ZAMG, enlargement of model domain (Alps), build up of AROME assimilation system, adaptations in model physics
- ▶ **2012:** new HPC at ZAMG -> basis for operational use
- ▶ **Summer 2013:** extensive evaluation- and familiarization phase (ZAMG forecasters), continuous adaptations in model operations (assimilation, model physics)
- ▶ **January 2014:** Full operational use of AROME (= maximum fail safe, different backup scenarios)
- ▶ **2014:** continuous improvement of the system (data assimilation, microphysics, increase of forecast range, domain, etc.)

AROME – Operational Setup

Horizontal resolution	2.5km (432x320)
Vertical resolution	60 Levels
Runs / day	8 (00,03,..18,21 UTC)
Forecast Range	30h
Output-Frequency	1/h
Model time step	60sec
Coupling model	IFS (ECMWF)
Coupling update	3h or 1h
Assimilation	3DVAR / OI

Case study: Flood 2013

- Large scale event in northern Alps in Austria and Bavaria; May 30th – June 2nd
- Maximum amounts > 300mm/72h
- Area wide devastation with extensive economic damage and even loss of human lives
- Highest discharge at Danube in Vienna ever (> 11.000m³/sec)

72h precip. INCA 2013060300

Case study: Flood 2013

Model	24h precipitation sums for different model runs		
	31.5. 00UTC – 1.6. 00UTC	1.6. 00UTC – 2.6. 00UTC	2.6. 00UTC – 3.6. 00UTC
INCA analysis	33.7	44.5	68.6
AROME	30.5	42.1	63.9
ALARO	23.9	36.8	50.9
SAL (AROME)	0.02/-0.10/0.06	0.17/-0.06/0.01	-0.11/-0.07/0.02
SAL (ALARO)	0.24/-0.34/0.07	0.32/-0.19/0.01	0.25/-0.30/0.03

Much better forecast of precipitation in AROME for all 3 runs (area average); improved scores of structure, amplitude and location compared to ALARO

Higher peaks in AROME (> 150mm/24h)

But! Too strong gradient at the edge of the precipitation field

INCA An.

AROME

ALARO

Forecast for 02.06.2013 00 UTC – 03.06.2013 00 UTC

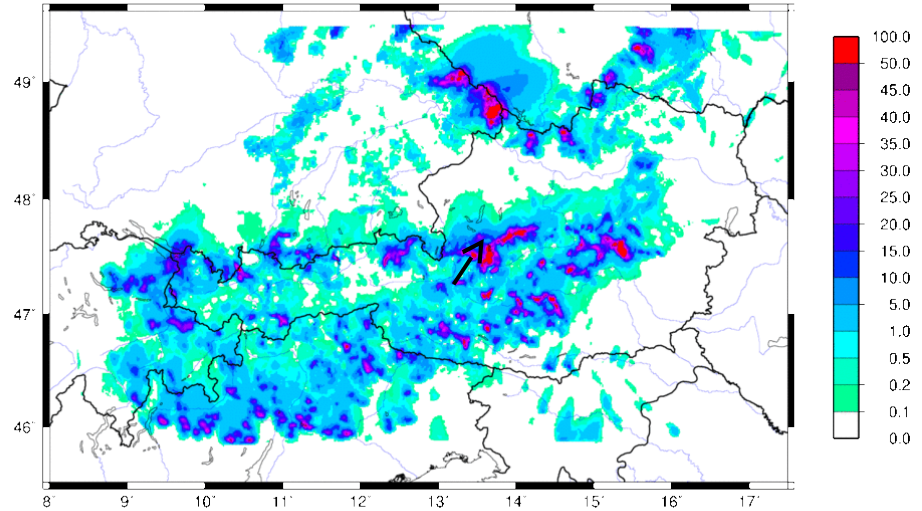

Case study: Thunderstorm - June 18th, 2013

IFS

INCA

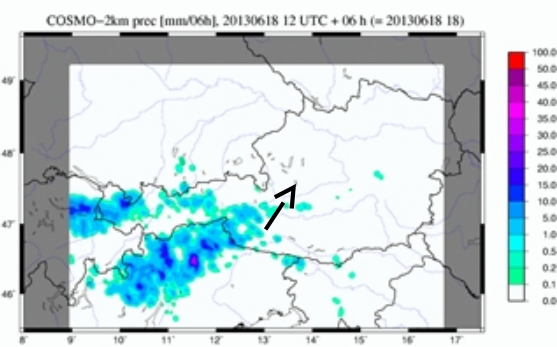

INCA Precip. Analysis [mm] 20130618 18 UTC, 06 h sum

ALARO

COSMO2

AROME

AROME-E-SUITE prec [mm/06h], 20130618 12 UTC + 06 h (= 20130618 18)

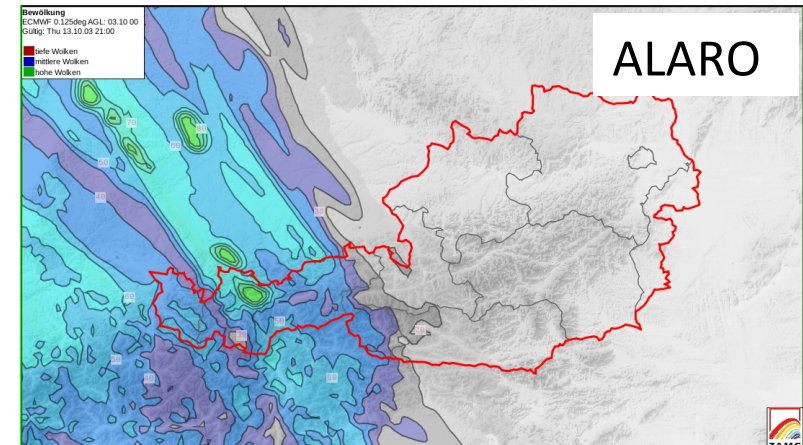

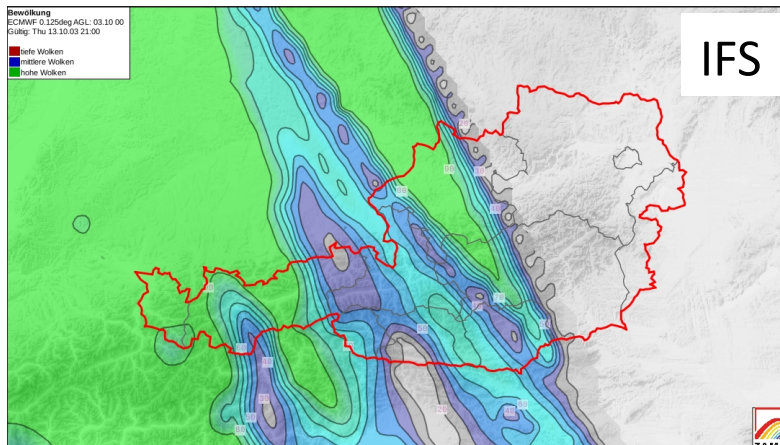

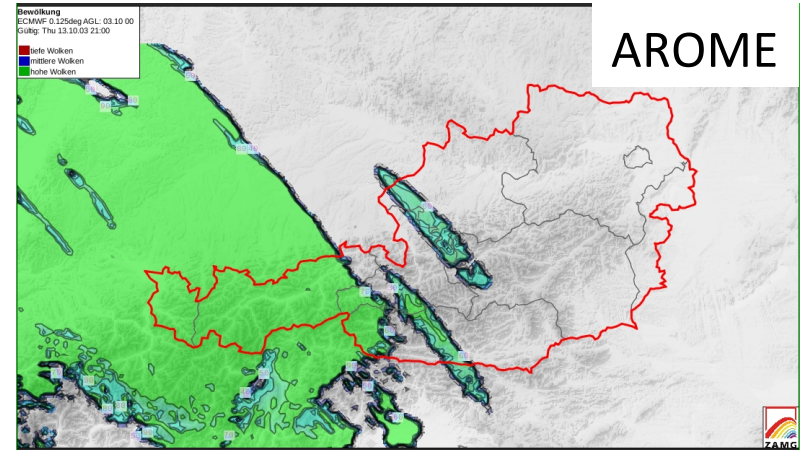

Case study: Low stratus – Oct. 31st, 2013

Cloud diagnostics problem

- ▶ Too binary clouds, especially high clouds

Oct. 3rd, 2013

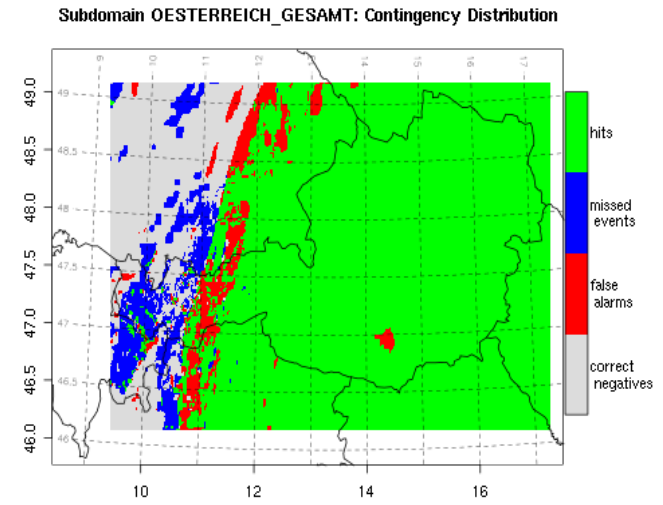

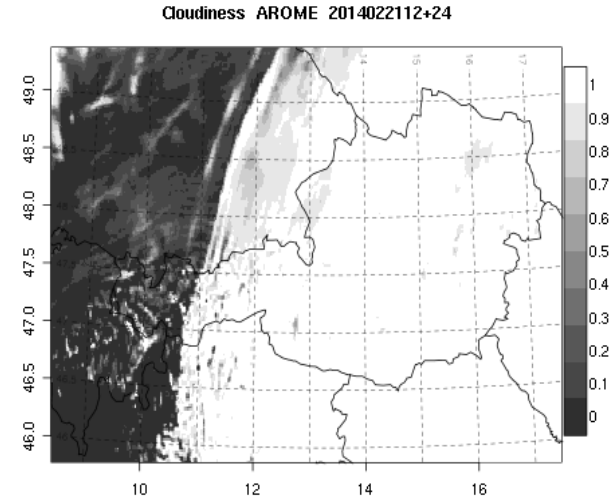

Improved cloud diagnostics

- ▶ not enough variance with original cloud scheme of AROME cycle 36
- ▶ cycle 37: Additional height dependent variance term proportional to qsat in routine condensation.f90:
$$PCLDFR=0.5+0.36*\text{atan}(1.55*ZQ1)$$
$$ZQ1=ZSBAR/ZSIGMA$$
$$ZSIGMA=\text{sqrt}((2*PSIGS)**2+(PSIGQSAT*ZQSL*ZA)**2)$$
- ▶ minimum of ZSIGMA is set to 10e-10 (10e-6 in cycle 36)
- ▶ we calculate ZSIGMA separately for low, medium and high clouds with different PSIGQSAT values (0.020, 0.025, 0.030)
- ▶ -> separate cloud fraction for low, medium and high clouds is passed to apl_arome.F90
- ▶ reduction of high clouds by a simple algorithm
- ▶ only diagnostic, no influence on other parameters (T, prec, wind, etc.)

SAL cloud verification

- ▶ SAL precipitation verification of Wernli et al. (2008) was adapted to cloudiness
- ▶ Reference: INCA total cloudiness (combination of satellite information and ground solar measurements)
- ▶ 3 values: S (structure), A (amplitude) and L (location) for predefined domains
- ▶ Contingency tables with hit rate, false alarms, etc.

SAL:

Structure: 0.07

Amplitude: 0

Location: 0.07

Contingency Table %:

Hits: 0.74

False Alarms: 0.05

Missed: 0.06

Corr. Negatives: 0.16

SP-class: 3 - Overcast

SAL cloud verification

- ▶ Realtime tool
- ▶ Selection of model, score and time period
- ▶ -> SAL values
- ▶ -> contingency tables

Online Model Verification-CLOUDS

select area	select parameter	select model	select verification period

SAL cloud verification

SAL-values (points) + 7 days running mean MAE (lines) for all models for lead time -12h

Multi | 12UTC | -12h | 100 days | region: A | param: A | 2013-12-14 - 2014-03-24

Outlook

Most important topics to be handled in near future:

- ▶ Luv/Lee problem: Too strong precipitation gradients in the Alps (tests with modifications in microphysics)
- ▶ Triggering of convection (too early onset)
- ▶ Intensity of convective precipitation (too high)
- ▶ Strong positive BIAS in small valleys at sunrise - orographic radiation scheme in SURFEX collaboration with MF and FMI + LACE
- ▶ AROME EPS
- ▶ AROME 1km version

Station verification:
period: 2110001 - 2110001
run: AROME 10 vs ALAROS 05
station: 14
parameter: 2m temperature
