1. Ensemble forecasting at the RMI of Belgium

2. Probabilistic storm forecasts for wind farms

3. RMI-EPS over Belgium and Madeira (Portugal)

Ensemble forecasting at the RMI

- ECMWF EPS (18km, operational, 2 runs per day)
- GLAMEPS (8km, still operational but phased out, 4 runs per day)
- RMI-EPS (2.5km, experimental and semi-operational, 2 runs per day)

Deterministic forecasting at the RMI

- ECMWF (9km, operational, 2 runs per day)
- ALARO (4km, operational, 4 runs per day)
- ALARO (1.3km, experimental, 4 runs per day)

(日)

 \Rightarrow operational products based on combination of ECMWF EPS and ALARO

NOTE: in addition our forecasters also look at other models (GFS, UKMO, AROME-MF, ...)

Probabilistic storm forecasts

- Wind farms in the North Sea
- Cut-out events (25 m/s and 30 m/s) for transmission system operator Elia
- ALARO (4km) wind speed (15min) at turbine height
- ECMWF EPS (18km) wind speed (1h) at 100m NOTE: only 3-hourly data before 23 Nov 2016.

Wind power model

Near misses for 29-30 November 2015

・ロト・西ト・ヨト・ヨー

Occasional sudden wind drop

Occasional sudden wind drop

Seems to be related to precipitation (in ALARO)

1h Precipitation 2018-11-10:00 +12h

Alaro 4km

RMI-EPS current set-up

- AROME and ALARO models (both at 2.5km) are coupled to ECMWF ENS (vertical 65L).
- 22 limited area ensemble members: 10+1 from ALARO and 10+1 from AROME (cy38h1.1, both with SURFEX).
- Forecast range: 48 hours (at 00 and 12 UTC).
- Surface assimilation cycle (CANARI) + 3DVar upper-air data assimilation for control members.

RMI-EPS future plans

Short term

• Additional surface perturbations.

- Should improve T2m spread.
- Influence on thunderstorm forecasts?
- An automatic monthly verification (of INDRA).

RMI-EPS future plans

Long term

Upper-air physics

- Multiphysics (e.g. different tunings).
- Tests with ALARO-1 (instead of ALARO-0).
- Perturbation of physical processes (parameter perturbation).
