

# **QPF over Austria**

**Amadeus project 2005-2006**

**E. Bazile, F. Wimmer, Y. Seity and Y. Wang**

&

# **Status of the TKE and the shallow convection in ARPEGE/ALADIN-MF**

E. Bazile (GMAP), P. Marquet (GMGEC), S.  
Malardel (GMME)  
GAME/CNRM (Météo-France/CNRS)

# QPF over Austria (Amadeus 2005-2006)

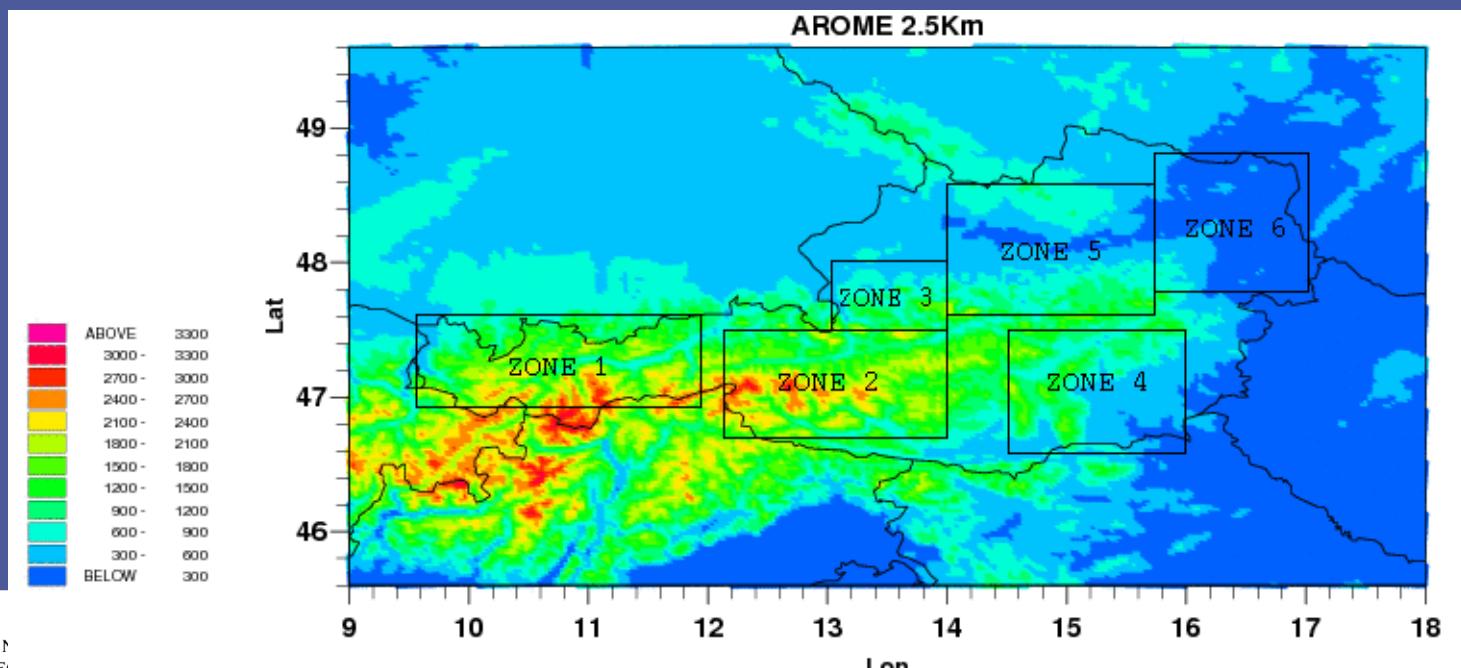

- August, October 2005 and April 2006 (in plan)
- HIRLAM will send the data ?
- and ALADIN-XX ?

# NWP models and experimental setup

- ARPEGE: Oper and PCS (oper since June 2006)  
25km
- ALADIN-MF : OPER and PCS 9.5km
- ALADIN-ZAMG 9km
- ALADIN-CHMI (M. Janouzek) 9km
- ALADIN –SHMU (M. Derkova) 9Km
- HIRLAM-INM (J.A. Garcia-Moya) 13km
- HIRLAM-RCR (K. Eerola)
- HIRLAM-KNMI (S. Tijm)
- AROME-Prototype 2.5Km

# NWP models and experimental setup

- 3 periods: August, October 2005 and April 2006
- 24h forecasts starting at 00UTC
- Two comparisons:
  - 24h precipitation accumulation (20km grid)
  - 0-6h, 6h-12h, 12h-18h, 18h-24h (10km grid)

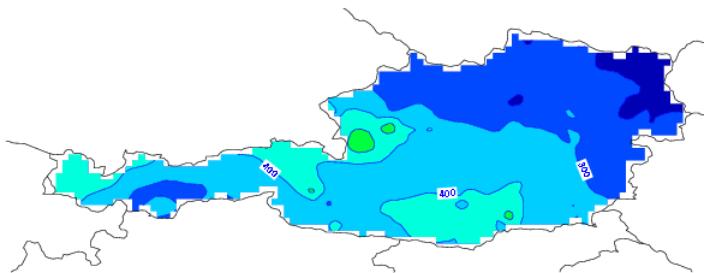

# POD, FAR, ETS, HSS

	Obs. Yes	Obs. No
Forecast Yes	Hit (a)	False Alarm (b)
Forecast No	Miss (c)	Correct rejection(d)

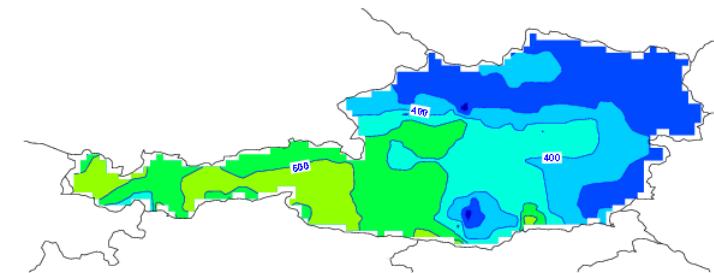

- POD Probability of Detection =  $a/(a+c)$
- FAR False Alarm Rate =  $b/(a+b)$
- ETS Equitable Threat Score = sensitive to the number of hits compared to the number of false alarm and misses:  
$$(a - R) / (a+b+c-R)$$
with R represents the number hits for random chance  
$$(a+b)(a+c)/n$$
- HSS=Heidke Skill Score =  $(a+d-\text{Ref})/(T-\text{Ref})$  with  
 $T=a+b+c+d$  and  $\text{Ref}=((a+b)*(a+c)+(b+d)*(c+d))/T$

# Cumulated rain for August, October 2005 and April 2006

## Remarks:

- The project is finished.
- Were the INCA analysis and the project interesting and useful to validate RR ?  
ARPEGE, ALADIN, HIRLAM and AROME

If yes how to continue ?  
Validation group ?

If no

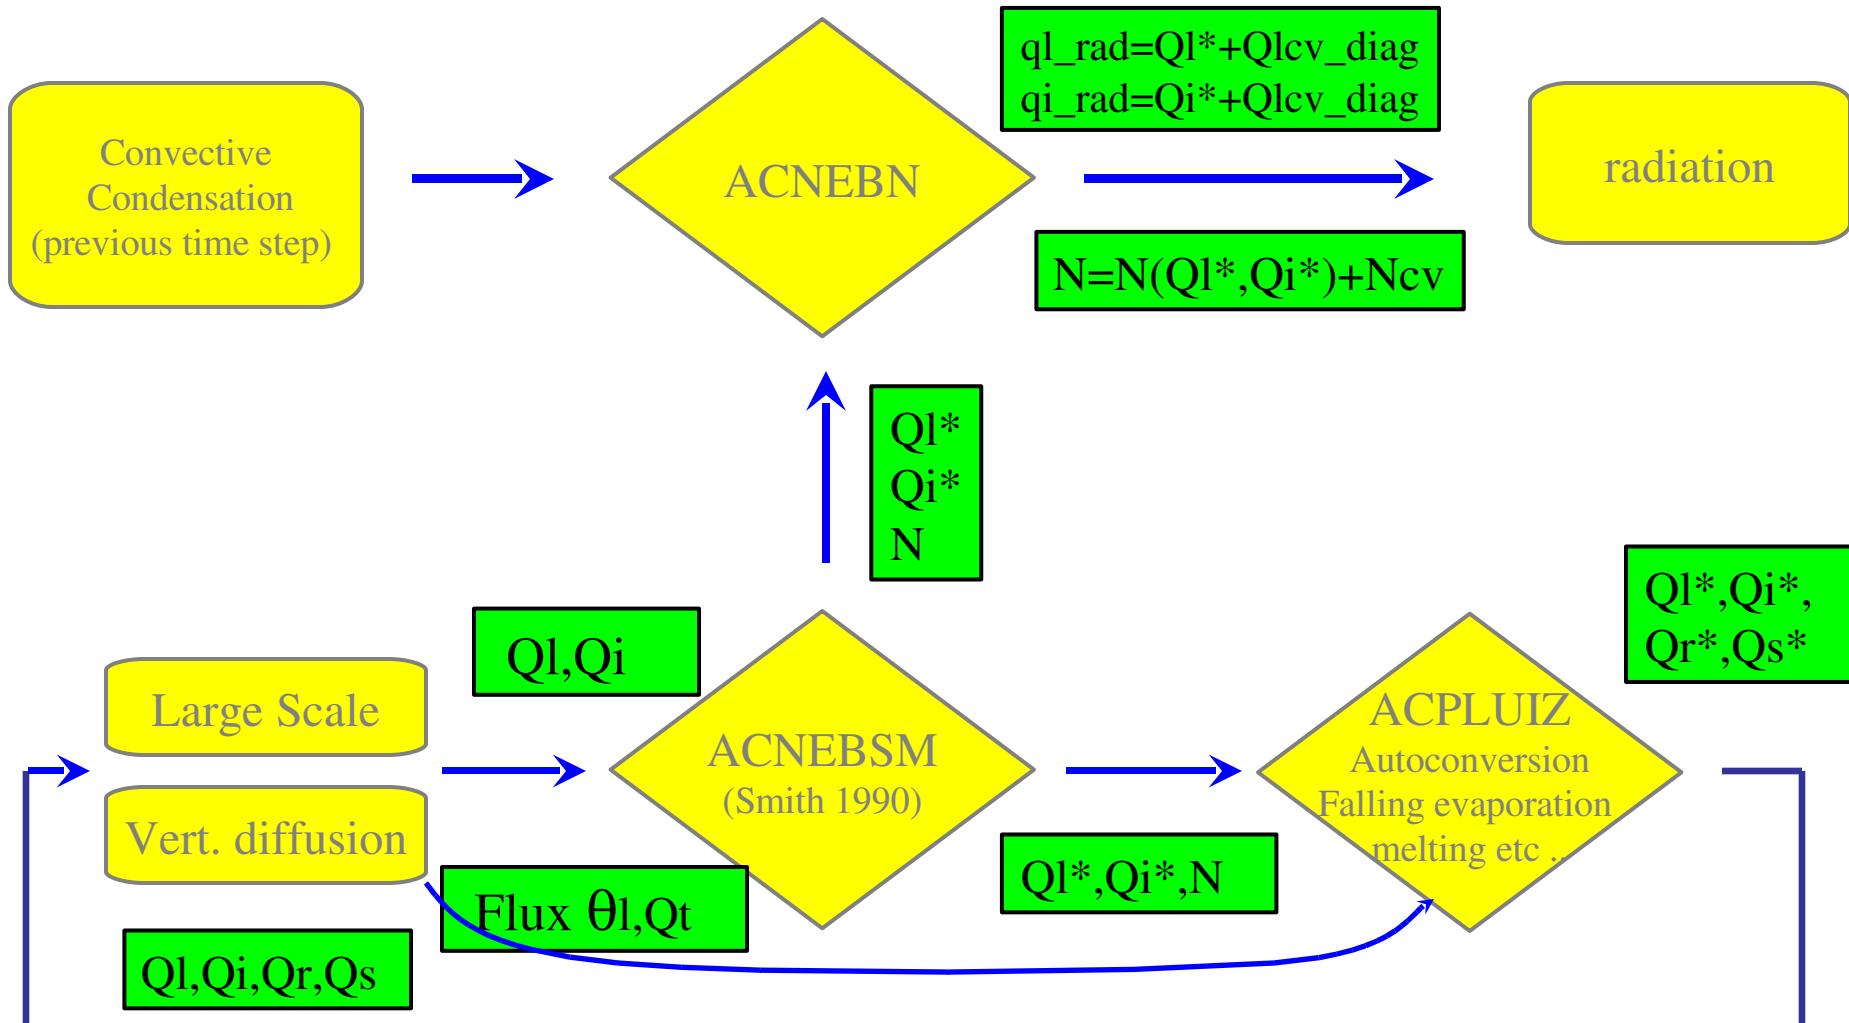

ALADIN Web Site <http://www.cnrm.meteo.fr/aladin> and daily outputs

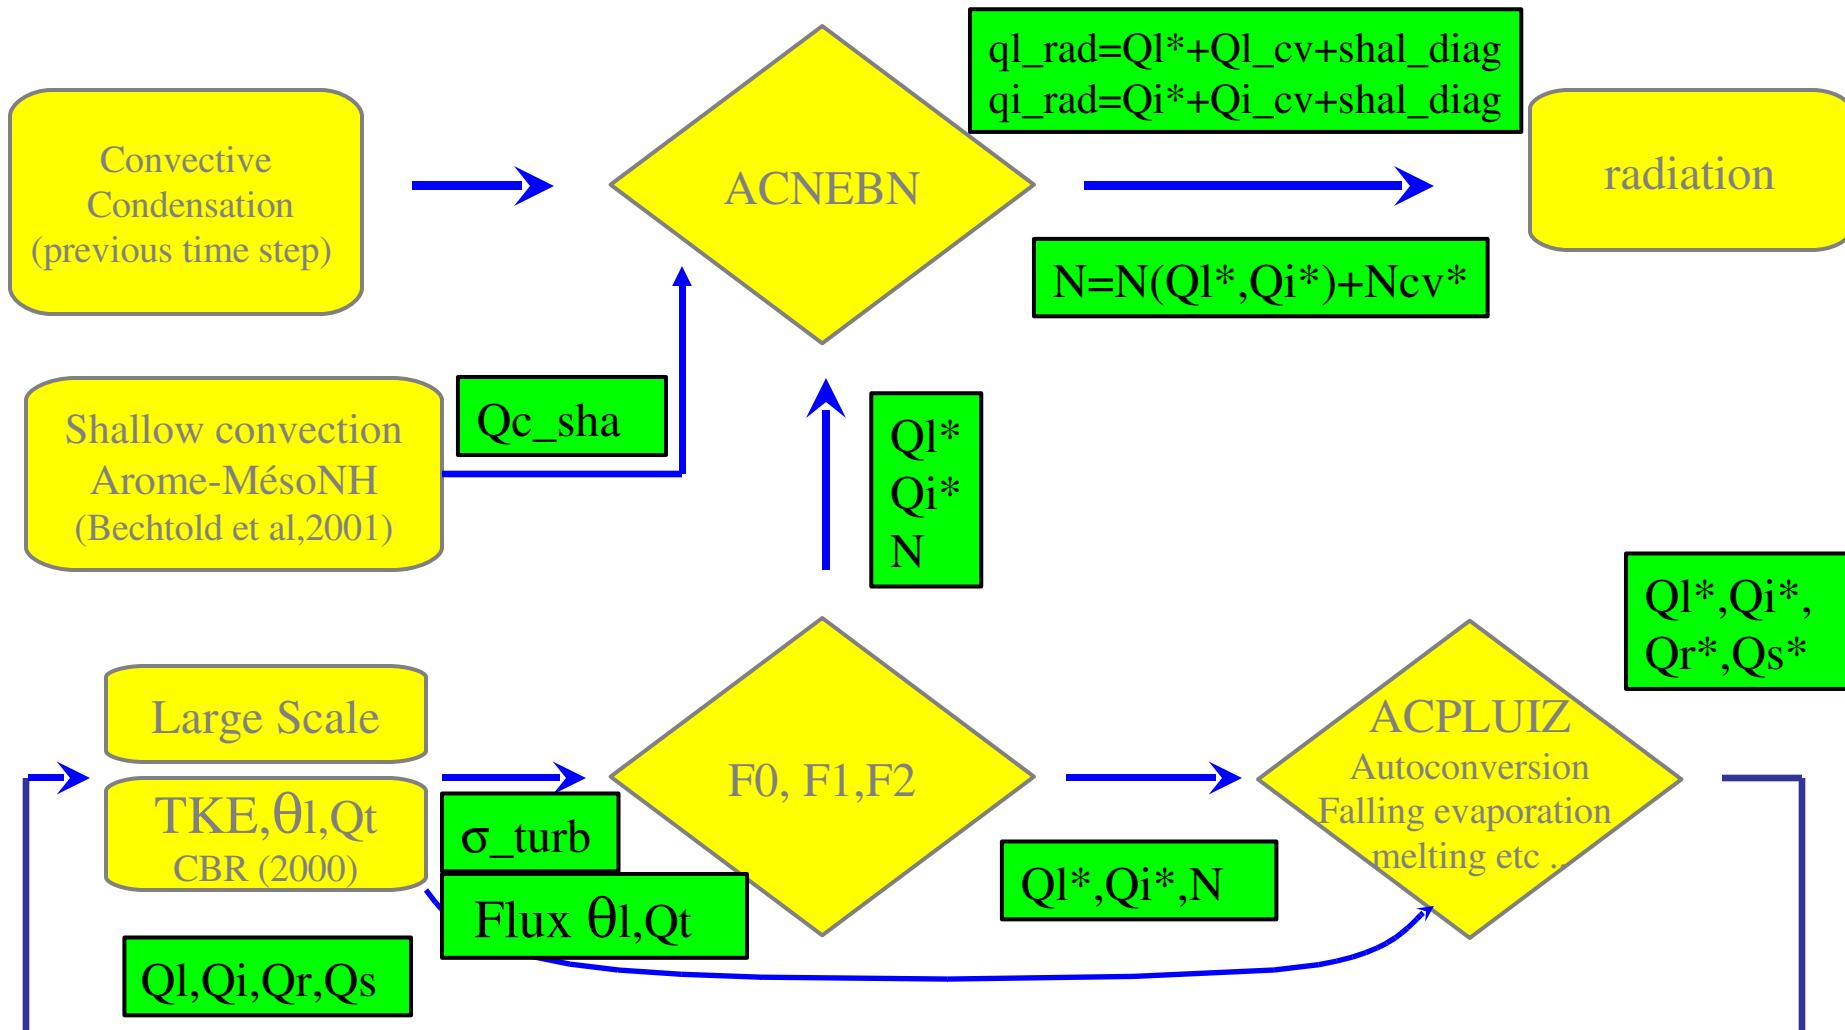

# TKE + Shallow convection

- TKE = CBR(2000) + BL (89) = same scheme as AROME but not the same code
- Shallow convection KFB 2001 = exactly the Meso-NH/AROME code
- ARPEGE/ALADIN Boundary layer scheme == AROME BL scheme → better consistency for the coupling file
- 1D validation on GABLS (1 and 2), BOMEX, Eurocs Cu (ARM)
- 3D experiment in ARPEGE and in ALADIN-MF
- Problems
- Perspectives

Oper

TKE+Shall

Wind Speed 10m

# Problems ...

- **Wind in the PBL only in 3D .**
  - Winter hemisphere.
  - Related with the stable conditions? With GWD or orography?
- **Cloud cover 0 or 1 near the surface (below 300m):**
  - Problem with the pdf function ? Sigma ? Do we need also a Sigma\_shallow ? Probably ?
  - shallow convection: not enough active, problem with the trigger function ?

# Perspectives

- **Short term :**
  - **Evaluation of the new shallow scheme (EDMF) of AROME and comparison with KFB in our context: ARPEGE/ALADIN microphysics, time-step, horizontal resolution**
  - **Other Mixing length ? (Hirlam, CMC ...)**
  - **F0, F1, F2 are very important.**
  - **Many interactions (mixing length, TKE, cloud cover function of L via sigma ) ? Do we need more constraints ?**
- **Medium and long term:**
  - **when the short term will be finished !**
  - **3MT**
